This guide is produced by Natural Resources Canada (NRCan) in cooperation with vehicle manufacturers. The Office of Energy Efficiency (OEE) at NRCan thanks the Canadian Vehicle Manufacturers' Association and Global Automakers of Canada for their assistance in the production and distribution of the 2013 *Fuel Consumption Guide*. Special thanks are extended to Environment Canada for collecting and compiling the fuel consumption data provided by vehicle manufacturers.

The OEE, Canada's centre of excellence for energy, efficiency and alternative fuels information, is mandated to strengthen and expand Canada's commitment to energy efficiency in order to help address the Government of Canada's policy objectives. The annual *Fuel Consumption Guide* is one of a variety of decision-making tools available from the OEE that make the relative energy efficiency and energy performance of different products more visible to Canadian consumers.

Introduction

The 2013 *Fuel Consumption Guide* provides model-specific estimated fuel consumption information about 2013 model year light-duty vehicles. The information can be used to compare the fuel consumption of different models and help you to select the most fuel-efficient vehicle that meets your everyday needs. The guide is published in print and on the Web at **vehicles.nrcan.gc.ca**.

Fuel use is an ongoing expense and should be considered when purchasing or leasing a vehicle. Choosing the most fuel-efficient and appropriate size of vehicle, driving in a fuel-efficient manner, using your vehicle only when needed and following the manufacturer's operation and maintenance recommendations for your vehicle can save you fuel and money year after year – even more if fuel prices rise.

The choices you make about the vehicle you drive and how you drive it also have a significant impact on the environment and our health. Greenhouse gases (GHGs), particularly carbon dioxide (CO_2), are produced when fuel is burned in your vehicle's engine. CO_2 emissions are directly proportional to the amount of fuel consumed – for every litre of gasoline used, about 2.3 kilograms (kg) of CO_2 are generated. Although not directly harmful to our health, CO_2 emissions contribute to climate change.

Visit **vehicles.nrcan.gc.ca** to find out more about buying and driving your vehicle to save fuel, save money and reduce your impact on the environment.

To request additional copies of the guide, call 1-800-387-2000 (toll-free).

A message from vehicle manufacturers

The 2013 *Fuel Consumption Guide* and the EnerGuide fuel consumption label included with all new light-duty vehicles are produced in cooperation with vehicle manufacturers and Natural Resources Canada.

Purchasing a new vehicle is a major decision involving many factors. The information in this guide will assist you in comparing relative fuel consumption ratings among vehicles that meet your utility, performance and lifestyle needs. While the fuel consumption ratings of a vehicle are one purchase consideration, how you operate and maintain your vehicle also affects the amount of fuel consumed.

To optimize fuel efficiency, your vehicle must be properly maintained and run on clean, high-quality fuels. To reduce the amount of fuel you use, always follow the recommendations for fuel formulation and for vehicle maintenance and operation provided in your owner's manual.

Together we can reduce the amount of fuel used for personal transportation and the resulting GHGs.

About fuel consumption ratings

The fuel consumption information appearing in the annual *Fuel Consumption Guide* is collected in conjunction with Environment Canada's Energy and Transportation Directorate. Environment Canada monitors the emissions of new light-duty vehicles sold in Canada by collecting detailed data from manufacturers and importers and by testing selected vehicles.

Vehicle manufacturers test their own vehicles using standardized testing and analytical procedures to generate the fuel consumption data published in this guide and shown on the EnerGuide Label for Vehicles. Environment Canada compiles the data received from the vehicle manufacturers, and NRCan uses this data and other information to publish the *Fuel Consumption Guide*.

Vehicle manufacturers are not required to submit fuel consumption data for the following:

- special purpose vehicles and passenger vans with a gross vehicle weight rating (GVWR) of more than 4536 kg (10 000 lb.) – GVWR is the weight of the vehicle plus maximum carrying capacity (passengers and cargo)
- other vehicles with a GVWR of more than 3856 kg (8500 lb.) or a curb weight of more than 2722 kg (6000 lb.) – curb weight is the weight of the vehicle without passengers and cargo

Vehicles that exceed these limits are not tested, so their fuel consumption is not available for the guide or EnerGuide label.

Also, in some cases, fuel consumption information was unavailable before publication, so some new vehicle models may not appear in the printed guide. To find the latest updated fuel consumption ratings for light-duty vehicles, visit **vehicles.nrcan.gc.ca** or consult your vehicle manufacturer or dealer.

Fuel consumption testing

It would be difficult to drive every model of new vehicle on the road to measure fuel consumption, and almost impossible to consistently duplicate on-road testing results because many variables can affect a vehicle's performance. Instead, a controlled laboratory testing method is followed to ensure that all vehicles are tested under identical conditions and that the results are consistent and repeatable.

Fuel consumption ratings are based on two test cycles:

- **city test** – simulates urban driving in stop-and-go traffic
- **highway test** – simulates a mixture of open highway and rural road driving, typical of longer trips

The Government of Canada is planning to change the methodology for determining estimated fuel consumption values of new light-duty vehicles to better approximate real world driving conditions and behaviours. The new methodology will incorporate three additional test cycles that account for air conditioner usage, cold temperature operation, and higher speeds with more rapid acceleration and braking. This 5-cycle testing procedure results in higher fuel consumption ratings compared to the 2-cycle testing methodology. For most vehicles, consumption values will increase by about 15%. Values may be higher for some vehicles and technologies. It is anticipated that this change will be implemented by 2015.

Note: Some vehicle manufacturers have provided 5-cycle energy/fuel consumption values for their 2013 model year advanced technology vehicles (see page 10). As such, the published ratings for these vehicles are not directly comparable to those based on the 2-cycle testing methodology. These models are indicated by an asterisk (*) in the vehicle tables.

CAUTION ON USING U.S. FUEL ECONOMY DATA

Fuel consumption ratings in Canada (expressed in litres per 100 kilometres [L/100 km] or miles per imperial gallon [mi./gal.]) differ significantly from fuel economy ratings in the United States. The U.S. fuel economy ratings are based on 5-cycle testing procedures, are listed in miles per U.S. gallon, and reflect U.S. sales and adjustment factors.

Your fuel consumption will vary

The ratings that appear on the EnerGuide Label for Vehicles and in the 2013 *Fuel Consumption Guide* show the fuel consumption that may be achieved with a properly maintained vehicle driven with fuel efficiency in mind.

The ratings provide a reliable comparison of the fuel consumption of different vehicles. However, no test can simulate all possible combinations of conditions that may be experienced by drivers. Your vehicle's fuel consumption will vary from the published ratings, depending on how, where and when you drive.

The following factors will significantly affect the fuel consumption of your vehicle: your driving style and behaviour, vehicle acceleration, braking and driving speed, overall age and condition of your vehicle, temperature, weather, traffic and road conditions, and drive systems and powered accessories (e.g. air conditioning) installed on your vehicle. In addition, small variations in vehicle manufacturing will cause fuel consumption differences in the same make and model, and some vehicles do not attain optimal fuel consumption until they are "run in" for about 6000 to 10 000 km.

The published ratings are a useful tool for comparing vehicles before you buy, but they may not accurately predict the fuel consumption you will get.

For more information on fuel consumption ratings and factors that affect fuel consumption, including tips to get the most fuel savings out of your new vehicle, visit **vehicles.nrcan.gc.ca**.

EnerGuide Label for Vehicles

The EnerGuide label is affixed to all new light-duty vehicles – including passenger cars, pickup trucks, special purpose vehicles and vans – for retail sale in Canada. The label provides the model-specific fuel consumption values for the vehicle to which it is affixed. Use the EnerGuide label to compare new vehicle fuel consumption information and identify the most fuel-efficient new vehicle for your everyday needs.

The EnerGuide Label for Vehicles is affixed to the vehicle alone or as part of the vehicle options and price label. EnerGuide labels should remain on new vehicles until they are sold. If a new vehicle has no label, ask the dealer for the manufacturer's fuel consumption information for the vehicle.

The fuel consumption ratings that appear on the EnerGuide label are provided by vehicle manufacturers and are based on standardized testing procedures performed under controlled conditions.

1. EnerGuide is the official Government of Canada mark for rating and labelling the energy consumption or energy efficiency of products, such as new vehicles, appliances, heating and cooling equipment, and houses that have had an energy efficiency evaluation. For more information on EnerGuide, visit **oee.nrcan.gc.ca/energuide**.
2. Compare the fuel consumption ratings of different vehicles to find out which vehicles consume the least amount of fuel.
3. Use the estimated annual fuel cost based on fuel type to assess potential fuel costs and savings when comparing new vehicles.
4. If your new vehicle dealer is out of stock, use the contact information on the label to order your free copy of the *Fuel Consumption Guide*.

NOTE: The Government of Canada will be introducing new redesigned EnerGuide fuel consumption labels for all new vehicles sold in Canada. The new labels will align with the labels used in the United States and provide more comprehensive information to help consumers choose more fuel-efficient vehicles. It is anticipated that the new labels will be introduced by 2015.

Comparing vehicles

Use the vehicle tables in this guide to compare the estimated fuel consumption values for 2013 model year vehicles. The vehicle with the best fuel consumption ratings and lowest estimated annual fuel cost will save you fuel and money for years. Remember, the lower the litres per 100 kilometres (L/100 km) rating, the lower the fuel consumption. Conversely, the higher the miles per gallon (mi./gal.) rating, the better the fuel use.

To find the fuel consumption ratings and estimated annual fuel use of 2000–2013 model year vehicles before you buy or lease, visit **vehicles.nrcan.gc.ca**.

Vehicle classes

In the guide, cars are divided into six classes – four are based on an interior volume index that combines passenger and trunk or cargo space, and two are based on car line (two-seaters and station wagons). Light trucks are divided into four classes – pickup trucks, special purpose vehicles, minivans and large vans.

Cars		**Light trucks**
Class	**Interior volume**	**Class**
Two-seater (T)		**Pickup Truck**
Subcompact (S)	less than 2830 L (100 cu. ft.)	**Special Purpose**
Compact (C)	2830–3115 L (100–110 cu. ft.)	**Minivan (V)**
Mid-size (M)	3115–3400 L (110–120 cu. ft.)	**Large Van (F)**
Full-size (L)	more than 3400 L (120 cu. ft)	
Station Wagon (W)		

Conversions

To convert L/100 km into mi./gal. or mi./gal. into L/100 km, use the following formulas:

$$\text{mi./gal.} = \frac{282.48}{\text{L/100 km}} \qquad \text{L/100 km} = \frac{282.48}{\text{mi./gal.}}$$

4.546 L = 1 imperial gallon = 1.2 U.S. gallons

To convert L/100 km into mpg (U.S.) or mpg (U.S.) into L/100 km, use the following formulas:

$$\text{mpg (U.S.)} = \frac{235.21}{\text{L/100 km}} \qquad \text{L/100 km} = \frac{235.21}{\text{mpg (U.S.)}}$$

3.785 L = 1 U.S. gallon

To help you compare vehicles that use electricity, a conversion factor is used to convert electrical energy consumption values, expressed in kilowatt hours per 100 kilometres (kWh/100 km), into gasoline litres equivalent per 100 kilometres (L_e/100 km). One litre of gasoline contains the energy equivalent of 8.9 kWh of electricity.

L/100 km	mi./gal.	mpg (U.S.)	kWh/100 km
2.0	141	118	17.8
4.0	71	59	35.6
6.0	47	39	53.4
8.0	35	29	71.2
10.0	28	24	89.0

Estimated annual fuel use

Estimated annual fuel use is based on an annual driving distance of 20 000 km with a mix of 55 percent city driving and 45 percent highway driving.

NOTE: The calculation used to determine the estimated annual fuel use is based on the combined fuel consumption rating. This combined rating is calculated using city and highway fuel consumption values that are later rounded for publication. Consequently, vehicles with identical published city and highway fuel consumption ratings may not have identical estimated annual fuel use values, due to the rounding process.

Estimated annual fuel cost

Estimated fuel costs for model year 2013 are based on forecast prices of $1.29/L for regular gasoline, $1.41/L for premium gasoline, $1.29/L for diesel fuel and $0.12/kWh for electricity. Pricing for E85 is not provided in the guide.

REMEMBER: Fuel prices higher than the above forecasts will result in annual costs higher than those printed in this guide and on the EnerGuide label.

Estimated annual CO_2 emissions

Tailpipe CO_2 emissions are based on the amount and type of fuel, using conversion factors of 2.3 kg of CO_2 per litre of gasoline, 2.7 kg of CO_2 per litre of diesel fuel, 1.6 kg of CO_2 per litre of E85, and 0 kg of CO_2 per kWh of electricity.

REMEMBER: The lower your fuel use and CO_2 emissions, the lower your impact on the environment.

Alternative fuels and technologies

Ethanol

Ethanol is a renewable fuel made from plants, which absorb CO_2 while growing. This absorption offsets some of the CO_2 emissions released from the tailpipe when ethanol is used to fuel a vehicle. Because of this, using ethanol in place of non-renewable fossil fuels, such as gasoline, reduces GHG emissions. The level of GHG emissions reduction depends on a number of factors, including the percentage of ethanol in the fuel blend.

All major vehicle manufacturers design their vehicles to run year-round on gasoline containing an ethanol blend of up to 10 percent (E10), without modification. E10 is available at many service stations across Canada.

Several vehicle manufacturers offer flexible-fuel vehicles (FFVs) that can run on ethanol blends of up to 85 percent ethanol (E85) and 15 percent gasoline. Ethanol contains less energy than gasoline, so in higher-level blends such as E85, more fuel is needed to travel the same distance.

Biodiesel

Biodiesel is another fuel made from renewable resources (plant or animal materials). Using blends of diesel fuel with biodiesel can reduce GHG emissions compared with using unblended diesel. The level of GHG emissions reduction depends on a number of factors, including the percentage of biodiesel in the fuel blend. New diesel-powered vehicles are designed to operate on diesel fuel containing up to 5 percent biodiesel (B5) year-round, without modification.

Hybrid-electric vehicles

Hybrid-electric vehicles combine a battery-powered electric motor with a conventional internal combustion engine. Thus they offer the driving range and rapid refuelling of conventional vehicles, together with features of electric vehicles. Hybrids cannot be charged using external electricity – they use the gasoline engine, regenerative braking, and the energy produced from coasting to recharge their batteries. Through increased fuel efficiency and reduced fuel use, hybrids can reduce GHG emissions.

Advanced Technology Vehicles

Plug-in hybrid electric

Plug-in hybrid electric vehicles (PHEVs) are hybrids with high-capacity batteries that can be charged by plugging them in. Although PHEVs don't have to be plugged in to be driven, they will not achieve optimal fuel consumption or maximum driving range without charging.

There are two basic types of PHEVs available:

- Series PHEVs – an internal combustion engine is used to generate electricity only; an electric motor is used to propel the vehicle. They can run in electric-only mode until the battery needs to be recharged. The engine will then generate the electricity needed to power the electric motor. When operating in electric-only mode, series PHEVs produce no tailpipe emissions.
- Blended PHEVs – an internal combustion engine and an electric motor are connected to the wheels, and both propel the vehicle under most driving conditions. Electric-only operation may occur at lower speeds.

Battery-electric

Battery-electric vehicles (BEVs) are propelled by an electric motor (or motors) that draw electricity from on-board rechargeable batteries. When the batteries run low, they must be plugged in to recharge. Electric vehicles produce no tailpipe emissions.

For more information on these and other alternative fuels and technologies, visit **vehicles.nrcan.gc.ca**.

Saving fuel: Tips on driving and maintenance

Once you have chosen the most fuel-efficient vehicle for your everyday needs, you can maximize your vehicle's efficiency and reduce your vehicle's impact on the environment by following these tips.

Consult your owner's manual. It contains important information about how to drive and maintain your vehicle for optimum performance and efficiency.

Driving tips

- **Accelerate gently**: The harder you accelerate, the more fuel you use. In the city, where about half of the fuel you consume is used to accelerate your vehicle, you can save as much as 15 percent by pressing the pedal gently. Imagine an open cup of coffee on your dashboard – don't spill it!
- **Maintain a steady speed:** You will not only consume less fuel but also help enhance traffic flow, minimize emissions and enjoy safer driving conditions. Use cruise control for highway driving, where conditions permit, to maintain a steady speed and optimize your fuel savings.
- **Anticipate traffic**: Hard braking and rapid acceleration burn more fuel and are unsafe. Drive defensively and watch ahead for changes in traffic flow. When possible, leave plenty of space between you and the vehicle in front of you.
- **Coast to decelerate**: By anticipating slowdowns and removing your foot from the accelerator as early as possible, you can decrease your speed and conserve fuel. Most vehicles today have fuel-injection systems that automatically shut off the flow of fuel to the engine when the accelerator is released, so take advantage by coasting.
- **Avoid high speeds**: The faster a vehicle travels above 80 km/h, the more fuel it consumes. For example, a vehicle uses about 20 percent more fuel to go 120 km/h than to go 100 km/h. Slow down for safer and more fuel-efficient driving.
- **Don't idle unnecessarily**: If you are going to be stopped for more than 60 seconds – when parked – turn the engine off.

- **Use air conditioning sparingly**: Due to the extra load on the engine, air conditioning can increase your vehicle's fuel consumption by 20 percent. Roll down your windows when city driving, or use your vehicle's flow-through ventilation on the highway.
- **Lighten your load**: Roof and bicycle racks decrease your vehicle's aerodynamics and heavy items in your trunk add weight, causing your vehicle to burn more fuel. Take only what you need.
- **Make one long trip instead of several short ones**: Separate trips of less than 5 km do not allow a cold engine to reach its peak operating temperature, resulting in increased fuel consumption and emissions. Combine trips into one outing to save time, fuel and money.
- **Drive less often**: You can reduce your fuel consumption to zero by walking, biking, carpooling or using public transit.

Maintenance tips

- **Follow your vehicle's recommended maintenance schedule**: A poorly maintained vehicle may consume more fuel. Poor maintenance adversely affects performance, may result in higher levels of emissions and often leads to expensive repairs and lower resale value.
- **Check fluid levels at least once a month**: Check and change the engine oil, engine coolant, automatic transmission and other fluids according to the manufacturer's recommendations in your owner's manual.
- **Check your tires**: Measure the inflation level of your tires once a month, preferably when they are cold. Operating a vehicle with the tires under-inflated by just 56 kilopascals (8 pounds per square inch) can reduce the life of the tires by more than 10 000 km and increase the vehicle's fuel consumption by up to 4 percent. To find your vehicle's recommended tire pressure, look for the vehicle information placard affixed to your vehicle, or check your owner's manual.

ecoENERGY for Vehicles Awards

NRCan recognizes the manufacturers of the most fuel-efficient new light-duty vehicles in their class sold in Canada each model year. Best-in-class vehicles have the lowest estimated annual fuel use, based on 20 000 km driven with a mix of 55 percent city and 45 percent highway. In this guide, the most fuel-efficient vehicle(s) in each class is identified by **boldface** type in the vehicle tables.

The Most Fuel-Efficient Vehicles for Model Year 2013

Cars	
Two-seater	**smart fortwo electric drive** 35 kW electric motor, 1-speed automatic
Subcompact	**Mitsubishi i-MiEV** 49 kW electric motor, 1-speed automatic
Compact	**Ford Focus Electric** 107 kW electric motor, 1-speed automatic
Mid-size	**Nissan LEAF™** 80 kW electric motor, 1-speed automatic
Full-size	**Tesla Model S** 270 kW electric motor, 60 kWh battery, 1-speed automatic
Station Wagon	**Toyota Prius v** 1.8 L, 4 cylinder hybrid, continuously variable
Light trucks	
Pickup Truck	**Toyota Tacoma** 2.7 L, 4 cylinder, 5-speed manual
Special Purpose	**Mazda CX-5** 2.0 L, 4 cylinder, 6-speed manual
Minivan	**Mazda5** 2.5 L, 4 cylinder, 5-speed automatic with select shift
Large Van	**Ford Transit Connect Van** 2.0 L, 4 cylinder, 4-speed automatic

Understanding the Tables

MODEL
The most fuel-efficient vehicle(s) in each class is identified by **boldface** type

AWD
All-Wheel Drive – vehicle designed to operate with all wheels powered

4WD/4X4
Four-Wheel Drive – vehicle designed to operate with either two wheels or four wheels powered

FFV
Flexible-fuel vehicle – vehicle designed to operate on gasoline and ethanol blends of up to 85 percent ethanol

CAR CLASSES
T = Two-seater; **S** = Subcompact; **C** = Compact; **M** = Mid-size; **L** = Full-size; **W** = Station Wagon

LIGHT TRUCK CLASSES
V = Minivan; **F** = Large Van; Pickup Truck; Special Purpose

ENGINE SIZE/MOTOR
Total displacement of all cylinders (in litres [L]); Electric motor peak power output (in kilowatts [kW])

CYLINDERS
Number of engine cylinders or engine rotors; **R** = Rotary engine

FUEL TYPE
X = Regular gasoline; **Z** = Premium gasoline; **D** = Diesel; **E** = E85; **B** = Electricity

TRANSMISSION
A = Automatic; **AM** = Automated manual; **AS** = Automatic with select shift; **AV** = Continuously variable; **M** = Manual; Number of gears/speeds (1–8)

CONSUMPTION

Fuel consumption ratings are shown in litres per 100 kilometres (L/100 km) and, for most vehicles, in miles per imperial gallon (mi./gal.).

For FFVs, estimated consumption values are provided for both gasoline and E85.

For advanced technology vehicles, estimated energy consumption is expressed in kilowatt hours per 100 kilometres (kWh/100 km) and litres equivalent per 100 kilometres (L_e/100 km). One litre of gasoline contains the energy equivalent of 8.9 kWh of electricity.

For PHEVs, estimated consumption values are provided for electric-only or blended electric and gasoline mode, and for gasoline-only operation.

Estimated annual fuel use and cost are based on 20 000 km driven and a combined rating of 55 percent city and 45 percent highway. The values provided for PHEVs reflect the two distinct modes of operation: 20 000 km driven exclusively in electric mode and 20 000 km driven exclusively in gasoline-only mode.

CO_2 EMISSIONS

Annual tailpipe carbon dioxide emissions (in kilograms) based on estimated annual fuel use and fuel type.

RANGE

For advanced technology vehicles, estimated driving distance (in kilometres) on a fully charged battery or full tank of gasoline.

RECHARGE TIME

Estimated time (in hours) at 240 volts to fully recharge the battery.

NOTE: For some advanced technology vehicles, 5-cycle testing criteria were used to determine the estimated fuel/energy consumption values. The additional criteria result in higher estimated consumption values compared to the 2-cycle testing methodology. Vehicle models with 5-cycle values are indicated by an asterisk (*).
